By a method similar to that above, he proved that its value is between 3 and $3\frac{1}{7}$, or, in decimals, between 3.1428 and 3.1408; he therefore assigned its value correctly within a unit of the third decimal place. The number $3\frac{1}{7}$, or 2, usually cited as Archimedes value of $7r$ (although it is but one of the two limits assigned by him), is often used as a sufficient approximation in rough computations. Metius (a.d. 1640) found the much more accurate value, which correctly represents even the sixth decimal place. It is easily remembered by observing that the denominator and numerator written consecutively, thus, 1131355, present the first three odd numbers each written twice. More recently, the value has been found to a very great number of decimals, by the aid of series demonstrated by the Differential Calculus. Clausen and Dase, of Germany (about A.d. 1846), computing independently of each other, carried out the value to two hundred decimal places, and their results agree to the last figure. The mutual verification thus obtained stamps their results as thus far the best established value to the two-hundredth place. (See Schumacher's Astronomische Nachrichten, No. 589.) Other computers have carried the value to over five hundred places, but it does not appear that their results have been verified. The value to fifteen decimal places is $\pi = 3.141592653589793$. For the greater number of practical applications, the value $\pi \approx 3.1416$.
