The intermeshing of two or more identical lattices weakens or causes to disappear some of the lines due to a single lattice, but can add no new lines. The cubic forms may be found on either the tetragonal or hexagonal plots. For example, the simple cube is given by the simple tetragonal lattice with axial ratio 1.00, or the rhombohedral lattice with axial ratio 1.225; the centered cube by the centered tetragonal lattice with axial ratio 1.00, the face-centered tetragonal lattice with axial ratio .707, or rhombohedral lattice with axial ratio .612; the face-centered cube by the face-centered tetragonal lattice with axial ratio 1.00, the centered tetragonal lattice with axial ratio 1.414, or the rhombohedral lattice with axial ratio 2.45. For the other three crystal systems, the orthorhombic, monoclinic, and tri-clinic, the graphical solution is less simple, since the relative crystal spacings must be expressed as a function of 2, 3, and 5 variables respectively. No simple method of representing these relations in a single plot is available, but in practice it may be found that many crystals belonging to these systems approximate sufficiently closely to one of the systems of higher symmetry, represented in Figs. 6-11, to enable the correct lattice to be guessed approximately from these plots, and found by a few trial calculations.
