The mutation probably occurred in a maternal X chromosome not many divisions prior to maturation. Both yellows were inherited as sex-linked recessives, and by crossing were shown to be allelomorphs. The determination of the locus of yellow to the left of notch and vermilion has already been discussed. Yellow is a valuable mutant because of the ease and accuracy of its classification, its possible identity with similar mutants in other species, and because it can be used with any other sex-linked mutant. Its viability is fair. Yellow in obscura does not occupy the extreme end position in the chromosome map, but in order to make comparison easier, it is treated as the zero point, and map distance based on linkage is computed in both directions. White (wO The first mutation to white occurred in culture 641, when a whiteeyed male was...
