Forgotten Books, United States, 2015. Paperback. Condition: New. Language: English . Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*. Excerpt from Description and Instructions for the Use of the Aberdeen Chronograph This chronograph was developed at the Aberdeen Proving Ground during 1918 and so constructed that the time taken for a projectile to pass over a measured path may be read upon a scale directly from the record strip. The measured path referred to is the distance between two sheet tin screens placed fifty feet apart in front of the gun. Wires are lad from these screens to the chronograph and the record is obtained by an electric spark which functions at the instrument when the projectile passes through the screen. The chronograph measures the time Interval between these two sparks as follows: A drum (Plate I) of known circumference(500 m/m) is rotated by a governed electric motor at a constant speed(25 revolutions per second). On the interior surface of this drum is carried a record strip of prepared paper which is held in position by centrifugal force. The linear velocity of this strip is 500 m/m x 26 r.p. s., or 12500 m/m per second. When the projectile passes through the first screen a spark jumps from the top spark point (Plate I), through the record strip, to the drum, perforating the paper strip. The drum continues to revolve and when the projectile reaches the second screen a spark perforates the paper from a lower sparking point. The motor is then stopped, the strip removed and the distance between these two spark punctures measured, which gives the lime the projectile took to pass from the first to the second screen. About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books. Find more at This book...
