The number of tangents finite in position which determine an w-fold parabola is the difference of these numbers, 2 (w-r 1). All the -i-fold parabolas, therefore, which touch 2 n +1 fixed lines form a singly infinite series; and it is easy to see that the locus of their foci is a circle. For if we draw an arbitrary line through the circular point t, one curve of the series can be drawn to touch it, and this determines uniquely the tangent from the other point j. These two tangents then, as before, are corresponding rays of The tangential equation to an?i-fold parabola is always faxat. a, =,yc, c2. c, rl, where a, a2, . are points of contact with the line infinity, and ev Cj, . points at infinity on tangents from the focus to the curve. From this we may deduce at once a construction analogous to (3), p. 134. In the case of the triple parabola this construction takes the simplified form intercept on X made by Av A =. y .-lVrt-r 1 sin (X, CJ sin(jL, C3) sin (X, Ca) where A, A are the focal tangents, and Cu C2, C3 the asymptotic directions, P may be determined by making X coincide with Av A, successively. two homographic...
